0 1 2 3 4 5 6 7

$f(n) = f(n-1) + f(n-2)$

$f(4) =$

```
F(n)                    Recursion
{
  if(n<=1)
    return n;
  return f(n-1) + f(n-2);
}
```

Recursion tree

f(4) ⇄
f(3) ⇄

overlapping sub problem
Memoization

@ Aashish kumar Nayak

PAGE NO.:
DATE: / /

Memorization) → tend to store the value of sub problems in some map/ table.

-1	-1	-1	-1	-1	-1
0	1	2	3	4	5
		1	2	3	5

initialy = -1

dp[n+1]

```
f(n)
{   if (n<=1)                    if(dp[n] != -1)
        return n;                     return dp[n];
    return f(n-1) + f(n-2);  (1)
}
```

(1) convert Recursion into Memorization.
(2) dp[n]

Recursion → DP

3 steps

declare a dp array
size of sub problem i.e. n

Step 1:- storing the answer which is being computed for every subproblem.

Step 2:- Checking if the subproblem has been previously solved. if it is previously solved

Step 3:- then the value will not be -1.

~~Step 3:-~~

@Aashish kumar Nayak

```
int f( int n , vector<int> &dp )
{
    if(n<=1 )
        return n;

    if( dp[n] != -1)
        return dp[n];

    return dp[n] = f(n-1, dp) + f(n-2 , dp);
}

int main()
{
    int n;
    cin>>n;
    vector<int> dp(n,-1);
    cout<< f(n,dp);
    return 0;
}
```

TC = O(N)

SC = O(N) + O(N)

@Aashish kumar Nayak

Recursion → Tabulation (Bottom - Up)
(Top down)

Base case to the Required

Answer require to base case

```
dp[n+1]
dp[0] = 0          dp[1] = 1

for(i=2; i<=n ; i++)
  {
    dp[i] = dp[i-1] + dp[i-2];
  }
```

Best solution (space optimization)

Intuitive solution

```
int main()
{
    int n;
    cin>>n;
    int prev2 = 0;
    int prev1 = 1;
    for(int i=2; i<=n; i++)
      {
        int curr = prev + prev2
        prev2 = prev;
        prev = curr;
      }
    cout << prev;
```

Climbing stairs problem | 1D problem

$n = 3$

* understand a DP problem :-

1. concept of try all possible way
   - count
   - best way
2. count the total no. of ways.
3. Optimal solution (min, max)

Then try to apply recursion

all possible ways

Imp.

Shortcut

1. Try to represent the problem in terms of index.
2. Do all possible steps on that index according to the problem statement.
3. If question say count all ways then sum of all steps.
4. min (of all steps) → find min

@Aashish Kumar Nayak

PAGE NO.:
DATE: / /

Frog Jump problem :

All possible ways, best ways, Means Recursion / DP

Why a greedy soln does not works?

Greedy fails here, so we have to try Recursion.

Recursion → Try all possible ways.
(min energy)

Step 1: index

Step 2: Do all steps on that index acc. to question.

Step 3: take @ the min (all steps).

Aashish Kumar Nayak

PAGE NO.:
DATE: / /

$f(n-1) \rightarrow$ min energy required to reach $(n-1)$ from 0.

$f(0) \rightarrow (0 \rightarrow 0) = 0$

Recurrence code

```
f(ind)
{
    if(ind==0)
        return 0;
                    // Now DO all stuffs on that
                       index +1 or -1, jump
    ~~left = f(n-1)~~
    left = f(ind-1) + abs(a[ind] - a[ind-1]);

    if(ind>1)
    {right = f(ind-2) + abs(a[ind] - a[ind-2]);
    }
                    // Now take the minimal

    return min(left, right);
}
```

f(5)
{
left = f(4) + (10) = 40 (30)

right = f(3) + (40) = 60 (20)

min(40, 60)
= 40

and so on

19/8

19/8

29/8

Now convert Recurence into DP

Recurence → DP

Memorization → look at the parameter are changing.

ind is changing

∵ Max size of ind is 5

∴ 5+1 = 6

dp[6]

Step 1: declare an array of size n+1

$\boxed{dp[n+1] := }$ — ①

Step 2: Before returning add it up. Store it and return.

```
return dp[ind] = min(left, right);
```
②

Step 3: Check if it is previously computed or not.

```
if(dp[ind] != -1)
    return dp[ind];
```
— ③

TC → O(N)

SC → O(N) + O(N)

Recursion array

@Ashish Kumar Nayak

Lets code

```
int f(int ind, vector<int> &height, vector<int> &dp) {
    if( ind == 0 )
        return 0;   [if(dp[ind] != -1) return dp[ind];]
    int left = f(ind-1, height, dp) + abs(height[ind] - height[ind-1]);
    int right = INT_MAX;
    if( ind > 1)
    {
        right = f(ind-2, height, dp) + abs(height[ind] - height[ind-2]);
    }
    return min(left, right);
    [return dp[ind] = min(left, right);]
}

int frogjump(int n, vector<int> &height)
{
    [vector<int> dp(n+1, -1);]   — (1) step
    return f(n-1, height, dp)
}
```

Only some test case will pass & T.L.E.

Now optimized Memoization

TC =
TC → O(N)
SC → O(N) + O(N)
recursion array dp

Step 1 :- declare dp
dp[n+1]

Step 2 :- store it and return (overlapping sub problem)
return dp[ind] = min(left, right);

Step 3 :- check if it is previously computed or not
if(dp[ind] != -1)
return dp[ind];

(@Aashish Kumar Nayak)

Memoization — Tabulation
(Top-down) (Bottom-up)

int dp[n] → for zero based index

Tabulation Method

```
int frogJump( int n, vector<int> & heights)
{
    vector<int> dp(n, 0);
    dp[0] = 0;

    for( int i=1; i<n; i++)
    {
        int fs = dp[i-1] + abs(height[i] - height[i-1])
        int ss = INT_MAX;
        if(i>1)
        {
            ss = dp[i-2] + abs( height[i] - height[i-2])
            dp[i] = min(fs, ss);
        }
        return dp[n-1];
    }
```

TC → O(N)
SC → O(N) + ~~O(N)~~
array dp — ~~Recursion~~ reduced

Space optimization

PAGE NO.:
DATE: / /

```
int frogJump(int n, vector<int> & height)
{
    int prev = 0;
    int prev2 = 0;

    for(int i = 1 ; i < n ; i++)
    {
        int fs = prev + abs(height[i] - height[i-1]);
        int ss = INT_MAX;
        if( i > 1 )
            ss = prev2 + abs(height[i] - height[i-2]);

        int curi = min(fs, ss);
            prev2 = prev;
            prev = curi;
    }

    return prev;
}
```

TC = O(N)

SC = ~~O(N)~~ + ~~O(N)~~
~~array dp~~ ~~Recursion~~

∴ SC = O(1)

both are reduced

Aashish Kumar Nayak

DP on Grids / 2D Matrix

- → Count paths
- → Count paths with obstacles
- → Min path sum
- → Max path sum
- → Triangle
- → 2 start points

6 problem

Total unique path

unique path

(0,0) → (1,1)

2 ways

(0,0) → (m-1, n-1)

Try all possible ways

Means apply Recursion

How to write Recursion

1. Express in terms of index (i,j) row col
2. Explore/Do all steps
3. Sum up all ways (min/max)

f(i,j) → no of unique ways (0,0) → (i,j)

f(i, j)
{ Base case
return 1 if reach destination
return 0 if can't reach destination
}

Partion Equal subset sum

PAGE NO.:
DATE: / /

{2, 3, 3, 3, 4, 5}

{2, 3, 5}
subset 1

{3, 3, 4}
subset 2

subset with n sum

Exactly 2 subset

$S_1 = S_2$

Entire array sum = S

$S_1 = S_2 = S/2$

S = total sum

if S = odd $\not\rightarrow$ (X)
not possible

if S = even
then look for target sum $\frac{S}{2}$

if one subset you got $(\frac{S}{2})$ then you already got 2nd subset.

NOW this question converts into

arr → [ ]
subset sum = $S/2$
where
S = total sum of given array.

@Aashish Kumar Nayak

Minimum coins | DP on subsequence

arr [ ] → {1, 2, 3} target = 7

coins may be {3, 3, 1} ans = 3 minimum coins

X (2, 2, 2, 1) ans = 4

Greedy

{1, 2, 3} target = 7

7/3 = 2 {3, 3, 1}

remain = 1

1/2 = 0 3 coins

1/1 = 1

Greedy work for this case but might failed in other case

lets take an example where greedy fails

{9, 6, 5, 1} target = 11

11/9 = 1

2 remain

2/6 = 0 ans should be 2+1 = 3 but

2/5 = 0 if we choose 6 & 5 ans = 2

2/1 = 2 so greedy fails here.

Approach:- Trying out all combos to form target

↓

take the combo that has min coins

Rules:-

1. Express the recurence in terms of index.
2. Express or do all steps.
3. Min. of all.

Knapsack

@Aashish Kumar Nayak

Whenever there is statement like

{ infinite supply, multiple case } it will stand at same index

T.C. → $O(2^n)$ it will not go back.

S.C. → $O(N)$ - recursion

```
f(ind, T)
{
  if(ind == 0)
    if( T % a[i] == 0) return T[a[0]]
    else return 1e9;

  int not_take = 0 + f(ind-1, T);
  int take = INT_MAX;
    if(coins [ind] <= T)
      take = 1 + f(ind, T- coins[ind]);
    return min(take, NOT_take);
}
```

✗ $\boxed{6}$ a[0]	target = 7
✓ $\boxed{7}$	target = 7
$\boxed{4}$	target = 12

Base case

T.C. → $\gg O(2^n)$

S.C. → $\gg O(N)$

Exponential.

Now we will Memoize it,

changing parameters → ind, target

dp[ind][target] = Now

T.C. = $O(N \times T)$

S.C = $O(N \times T) + O(T)$ Auxillary Space

@Aashish Kumar Nayak

Tabulation

*** Any memoization can be converted into tabulation.

1. Base case
2. find target and write it in opposite fashions.
3. copy the turbulance.

for any target.

```
for( T = 0 → Target)
        if( T % a[0] == 0 )
            dp[0][T] = T/a[0];
        else
            dp[0][T] = INT_MAX;
```

Code :-

```
int f(ind, int T, vector<int> &nums, vector<vector<int>> &dp)
{ if(ind == 0)
  { if ( T % nums[0] == 0)
        return T/nums[0];

      { int notTake = prev[sum];
        int take = 0;
        if(num[ind] <= sum)
            take = prev[sum - num[ind]];
        cur[sum] = (notTake + take);
      }
      prev = cur;
    }
    return prev[tar];
}
```

@Aashish Kumar Nayak

DP-22 ways to make coin change

N=3 | 1 | 2 | 3 | target=4

any element can be used any no. of times.

{1, 1, 1, 1} = 4
{1, 1, 2} = 4
{2, 2} = 4
{1, 3} = 4

4 differs

figure out total no. of ways → Try out all the ways
↓
Recursion

```
f( )
{
  Base case
  if destination is meet. 1 or 0
  else 0

  f4 ___
  f2 ___

  return (_ + _);
}
```

Recurance :-

1. Express → (ind, T)
2. Explore all possibility → not Take / take
3. Sum all possibilities and return.

{ In all the DP subsequen. problem.

| 1 | 2 | 3 |
0 1 2

f(2, 4)
ind T

The index 2, in how many ways can you form 4

@Aashish Kumar Nayak

```
f( ind, T)
{   if(ind == 0)
    {
      if( T % arr[0] == 0)
            return 1;
      else return 0;
    }
    notTake = f(ind-1, T);
    take = 0
    if( arr[ind] <= T)
        take = f(ind, T-arr[ind]);

    return notTake + take;
```

✓ $\boxed{4}$ arr[0] — tar = 4

× $\boxed{3}$ — tar = 4

✓ $\boxed{2}$ — tar = 4

tar % arr[0] that can be formed.

we are standing at same index.

So, T.C. >> $O(2^n)$ exponential

S.C. >> $O(N)$ — standing on the same index.

Memoization will solve this issue

T.C. = $O(N \times T)$

S.C = $O(N \times T) + O(\text{target})$ — auxiliary space ASS

we Tabulation to optimise ASS

steps :- Tabulation — Bottom-up approach

1. Base case
2. ind (1 — n-1)
   T → (0, T)
3. copy the recurrence.

for(T → 0 → target)
dP[0][T] = (T % arr[0] == 0)

Code :-

```
long countWaysToMakeChange( int *denomination, int n, int value)
{   vector<vector<int>> dp(n, vector<long>(value+1, -1));
    return f(n-1, value, denomination, dp);
}
```

@ Ashish Kumar Nayak

```
long f( int ind , int T, int *a, vector<vector<long> &dp ) :
  if( ind = = 0)
        return (T % a[0] = = 0);
  if(dp[ind] [T] != -1) return dp[ind][T];   // 1 or 0
long notTake = f(ind-1, T, a, dp)

  long take = 0
     if( a[ind] <= T)
          take = f (ind, T- a[ind], a, dp);

  return take + notTake;
}
   dp[ind][T] = take + notTake;
```

Tabulation :-

```
long countWaysToMakeChange( int *denomination, int n, int value)
{   vector<vector<long>> dp( n, vector<long (value +1, 0)) ;
  for(int T = 0; T <= value; T++)
   { dp[0][T] = (T % a[0] = = 0);
   }
  for (int ind = 1; ind < n; ind++)
     { for( int T = 0; T <= value ; T++)
        { long notTake = dp[ ind-1] [T];
          long take = 0;
          if( a[ind] <= T)
             { take = dp[ind] [T - a[ind]];
             dp [ind] [T] = take + notTake;
     }  }
  return dp[n-1][value];
}
```

@Aashish Kumar Nayak

Space optimization

Whenever you see like ind-1, ind, then you can always optimise by using couple of stuffs.

Code :-

```
long countWaysToMake( int *a, int n, int value)
{ ~~vector<vector<long>> dp(n, vector<long>(value+1,0));~~
~~vector<vector<~~
  vector<long> prev(value+1, 0), cur(value+1, 0);
  for (int T = 0; T<=value ; T++)
    { prev[T] = T % a[0] == 0);
    }
  for (int ind =1; ind<n; ind++)
    { for( int T=0; T<=value; T++)
      { long notTake = prev[T];
        long take =0;
        if(a[ind] <= T)
        { take = cur[T - a[ind]];
        cur[T] = take + notTake;
      }
    prev = cur;
    }
  return prev[value];
}
```

@Aashish kumar Nayak

DP-23 unbounded Knapsack

Prerequisite
DP-19 — 0/1 knapsack
in this there was only one occurances.

wt → {2, 4, 6}
val → {5, 11, 13}

W = 10

But here infinite supply of every item. we can pick any one item many times.

Ex:-
13 wt → 6 11 wt → 4

wt → 6
10

wt → 2 × 2
+ 5 × 2 = 23

wt → 4 × 2 + wt 2
11 × 2 + 5 = $\boxed{27}$ maximum possible value.

(wt → 2) × 5 = 10 wt
5 × 5 = 25 val

Base case we write for 0

val 10
wt 5
arr[0]

W = 8
if W = 2 ×
int $\left(\frac{W}{wt[0]}\right) \times val[0]$

```
f(ind, W)
{   if(ind == 0)
        return [ W/wt[0] × val[0] ];

    notTake = 0 + f(ind-1, W);
    take = INT_MIN;
    if( wt[ind] <= W)
        take = val[ind] + f(ind, W - wt[ind]);

    return max(take, notTake);
```

Memoize T.C. — exponential

Tabulation
1. Base case
2. Changing parameter ind
3. copy the recurance.

>> O(W)

@Ashish Kumar Nayak

so can be anything 0, 1, 2. — — — wt. bag

for(w → 0 to wt bag)

{ dp[0][w] = $\left(\frac{w}{wt[0]}\right)$ × val[0]

}

Code :- * memoized

```
int f(int ind, int w, vector<int> &val, vector<int> &wt,
      vector<vector<int>> &dp)
{
    int if( ind == 0)
        { return ((int)(w/wt[0])) * val[0];
        } if(dp[ind][w] != -1) return dp[ind][w];
int notTake = 0 + f(ind-1, w, val, wt, dp)
int take = 0;
if( wt[ind] <= w)
{   take = val[ind] + f(ind, w - wt[ind], val, wt, dp)
  }
return dp[ind][w] = max(take, notTake);
}

int unbounded knapsack (int n, int w, vector<int> &val,
        vector<int> &wt)
{ vector<vector<int>> dp(n, vector<int>(w+1, -1));
    return f(n-1, w, val, wt, dp);
}
```

@Aashish Kumar Nayak

Tabulation :-

~~vec~~

```
int unboundedknapsack(int n, int W, vector<int> &val,
                      vector<int> &wt)
{ vector<vector<int>> dp(n), vector<int>(wt+1, 0);
  for(int w=0; w<=W; w++)
  { dp[0][w] = ((int)(w/wt[0])) * val[0];
  }
  for(int ind=1; ind<n; ind++)
  { for(int w=0; w<=W; w++)
    { int notpick = 0 + dp[ind-1][w];
      int pick = 0;
      if(wt[ind] <= w)
      { take = val[ind] + dp[ind][w - wt[ind]];
      }
      dp[ind][w] = max(take, notTake);
    }
  }
  return dp[n-1][W];
}
```

@Aashish kumar verma

Space optimization

int-1, int — so space optimization is possible.

```
int unboundedKnapsack( int n, int w, vector<int> & val,
                       vector<int> & wt)
{
    vector<int> prev(w+1, 0), cur(w+1, 0);
    for (int w=0; w<= w; w++)
        { prev[w] = ((int)(w/wt[0])) * val[0];
    }
    for (int ind =1; ind<n ; ind++)
        { for (int w=0; w<=w ; w++)
            { int notTake = 0+ prev[w];
              int take =0;
              if(wt[ind] <= w)
              {
                take = Val[ind] + cur[w- wt[ind]];
              }
//prev[w]= max(take,notTake);
                Cur[w] = max(take, notTake);
            }
R           // prev = cur; //Remove this line
        }
    return prev[w];
}
```

Remove.

//prev[w - wt[ind]]

prev | 3 | 4 | 5 | 6 | 7 | 1 | 2 |

notTake = 3, 4 cur

take =

than we rewrite.

DP-24 Rod cutting problem | DP on subsequences

N = 5
↓ Rod length

Price array [ ]

2	5	7	8	10
1	2	3	4	5

length

For length 1 price = 2

For length 2 price = 5

we need to cut the rod into pieces

price 2 2 2 2 2
length 1 1 1 1 1 = 10

2 5 5
1 2 2 = 12 ↑ maximum

5 7
2 3 = 12 maximum

we need to print maximum cost.

1 2 3 4 5

Collect rod length to make N
↓
Maximize the price

Similar to Knapsack

2	5	7	8	10
0	1	2	3	4

means 4 length

means 5 length

Try to pick lengths and sum them up to make the given N.

in all possible ways.

↳ Recurrence

1. Express in terms of index
2. Explore all possibilities — not Take / Take
3. Maximize the price for possibilities.

2	5	7	8	10
0	1	2	3	4

$f(4, N)$

Till index 4, what is the minimum price you obtain

```
f(ind, N)
{
    if( ind == 0)
        return N x price[0];

    int notTake = 0 + f(ind-1, N);
    int take = INT_MIN;
        rod_length = ind+1;
        if( rod_length <= N)
            take = price[ind] + f(ind, N- rod_length);
    return max( take, notTake);
}
```

$n-1 \longrightarrow 0$

✓ $\boxed{6}$ —— $N = 12$

Price[0] → rod_length = 1

looking to make it.

{1, 1, 1 . . . 12 times}

Mem Tabulation :-

1. Base case
2. Changing parameter — ind, N
3. copy recurrence

Base case.

```
for ( N → 0 to n)
    dp[0][N] = N x price[0];
```

~~for~~ ind → 1 ⟶ n-1

N ⟶ 0 ⟶ N

(copy the recurrence)

@Aashish Kumar Nayak

```
int f(int ind, int N, vector<int> & price, vector<vector<int>> &dp)
{ if(ind == 0)
    { return N*price[0];
    }
  if(dp[ind][N] != -1) return dp[ind][N];
  int notTake = 0 + f(ind-1, N, price, dp);
  int take = INT_MIN;
  int rodLength = ind+1;
  if( rodLength <= N)
    {
      take = price[ind] + f(ind, N-rodLength, price, dp);
    }
  return dp[ind][N]=max(take, notTake);
}

int cutRod (vector<int> &price, int n)
{ vector<vector<int>> dp(n, vector<int>(n+1,-1));
  return f(n-1, n, price, dp);
}
```

Tabulation :-

```
int cutRod (vector<int> &price, int n)
{ vector<vector<int>> dp(n, vector<int>(n+1,0));
  for (int N=0; N<=n; N++)
    { dp[0][N] = N* price[0];
    }
  for(int ind = 1; ind<n; ind++)
    {  for( int N=0; N<=n; N++)
       {
```

@Aeshish Kumar Nayak

Scanned with OKEN Scanner

```
int notTake = 0 + dp[ind-1][N];
    int take = INT_MIN;
    int rodLength = ind+1;
    if( rodLength <= N)
    {
      take = price[ind] + dp[ind][N-rodLength];
    }
    dp[ind][N] = max(take, notTake);
  }
}
return dp[n-1][n];
}
```

Space optimization :-

```
int cutRod( vector<int> & price , int n)
{ vector<vector<int>> dp(n, vector<int> (n+1,0));
  vector<int> prev(n+1,0), cur(n+1,0);
  for(int N=0; N<=n; N++)
  { prev[N] = N* price[0];
  }
  for(int ind = 1; ind<n ; ind++)
  { for (int N =0; N<=n; N++)
    {
      int notTake = 0 + prev[N];
      int take = INT_MIN;
      int rodLength = ind+1;
      if(rodLength <= N)
      {
        take = price[ind] + cur[N- rodLength];
        // prev[N-rodLength]
      }
      cur[N] = max(take, notTake);
    }
    //prev[N]
  }
  ~~return dp~~ return dp[n-1][n];
}
```

we can do 1D array optimization like previous one.

@Ashish Kumar Nayak

DP on Strings

[DP on strings] → comparison of string
→ replace / edit

longest common [subsequences]

S_1 = "adebc" S_2 = "dcadb"

DP-25

Longest Common Subsequence :-

abc → [a, b, c, ab, bc, ac, abc, " "]

power set / ~~Rec~~ or Recursion ← we can use these ~~two~~ methods to print ~~all~~ the subset.

S_1 = "adebc" —— 2^5 subsequences

a, d, e, b, c, ad, ae, ac, de, db, dc, ade — —— adb

S_2 = "dcadb" —— 2^5 subsequences

d, c, a, d, b, dc, da, dd, db, - - — adb ← 3

we have to find all the subsequences and take out the longest one.

Brute force

generate all subsequences

take one & compare ↓ so on

T.C. :- O(exponential)

New approach

⇒ Generate all subsequences & compare on way.

↓

Recursion method, we will not generate instead we will use parameter to generate them.

@ Ashish Kumar Mayak

Scanned with OKEN Scanner

We will write some recurrence which give the answer through the way.

@Aashish Kumar Nayak

Rules to write the recurrence

(i) Express everything in terms of index.
(ii) Explore possibilities on that index.
(iii) take the best among them.

Lets take an example

d == d

ac | ce

ind2 ind1

if match

acd | ced

ind1 ind2

$1 + f(ind1-1, ind2-1)$;

ac | ce

if not match

ac | ce $\xrightarrow{+1}$ $f(ind1-1, ind2-1)$ it goes -ve

$0 + \max[f(ind1-1, ind2), f(ind1, ind2-1)]$;

$f(ind1, ind2)$ -ve means end of the strings.

```
{ //base case
  if(ind1 < 0 || ind2 < 0)
      return 0;

  if(s1[ind1] == s2[ind2])
      return 1 + f(ind1-1, ind2-1);

  return 0 + max[f(ind1-1, ind2), f(ind1, ind2-1)];
```

match

not match

0 1 2 | 0 1 2
acd | ced $f(2,2) = 2$

$+1 + 1 = 2$

ac | ce $f(1,1)$

a | ce $f(0,1)$ 0

ac | e 1 $f(1,0)$

1 $f(0,-1)$ 0

| ce $f(-1,1)$

a | e $f(0,1)$

0 0

$f(-1,1)$ $f(0,0)$

Recursion $2^n \times 2^m$ ≈ Exponential

↓ optimised IF there are overlapping sorce problem then apply memoization.

Code :-

```
int f(int i, int j, string &s, string &t, vector<vector<int>> &dp)
                i==0      j==0
{
    if(i<0 || j<0)
        return 0;
    if(dp[i][j] != -1) return dp[i][j];
    if(s[i] == t[j])
        return 1 + f(i-1, j-1, s, t);
    return dp[i][j] = max(f(i-1, j, s, t, dp), f(i, j-1, s, t, dp));
}
```

```
int lcs(string s, string t)
{
    int n = s.size();
    int m = t.size();
    vector<vector<int>> dp(n, vector<int>(m, -1));
    return f(n-1, m-1, s, t, dp);
}
```

T.C. - $O(N \times M)$

S.C. - $O(N \times M) + O(N+M)$

A.S.S.

2+2 = 4 alternate deletion

if we do alternate deletion then there can be n deletion from s_1 and m deletion from s_2.

@Aashish Kumar Nayak

Tabulation :-

1. copy the Base case
2. changing the parameter
3. copy the recurrance.

shifting of indexes.

-1 0 1 2 3 -- n-1

if (i == 0 || j == 0) return 0
return dp[0][j]

for(j = 0 → m-1) dp[0][j] = 0

for (i = 0 → n-1) dp[i][0] = 0

Code :-

```

DP-27 longest common substring :-

S_1 = "ab[jk]lp" S_2 = "a[jl]p"

should be consecutive

Les

matching

$dp[i][j] = 1 + dp[i-1][j-1]$

not matching

$dp[i][j] = \max(dp[i-1][j], dp[i][j-1])$

This will not work on substring

lets take an example

acd | axd

Breaking the consecutive rule

(+1)

ac | ax

a | ax ac | a

(+1)

| ax a | a c | a ac |

This is consecutive so we don't dependent on the previous guys.

no need to do a lookup directly put 0

$dp[i][j] = 0$

abcd abzd

		a	b	z	d
	0	1	2	3	4
	0	0	0	0	0	0
a	1	0	1	0	0	0
b	2	0	0	2	0	0
c	3	0	0	0	0	0
d	4	0	0	0	0	1

The maximum value in the entire matrix.

for( int i = 1; i<=n ; i++)
    { for(int j = 1; j<=m ; j++)
        if(s[i-1] == t[j-1])
            dp[i][j] = 1+ dp[i-1][j-1];
        else
            dp[i][j] = max(dp[i-1][j], dp[i][j-1]
    }
}
return dp[n][m];
}
int longestPalindromeSubsequence (string s)
{ string t = s;
  reverse(t.begin(), t.end());
  return lcs(s,t);
}
```

@Aashish Kumar Nayak

DP-29 Minimum insertions to make a string palindrome:

prerequisite → LCS
→ LPS

S = "abcaa"

↓

abcaa aa cba
reverse

max operation = len(S)

$\boxed{S + rev(S)}$ — becomes palindrome.

aa bc baa → palindrom and min operation = 2

Approach:-

keep the palindrome portion intact.

S = abcaa - a lot of palindrom so I will try to keep longest palindrome intact.

a b c a a

aaa

a b c a b a

we will match if not match then we will place copy of that in right part.

$\boxed{\text{code}}$ in ni $\boxed{\text{max}}$

$\boxed{n \text{ — longest palindromic subsequence}}$

size of string.

@Aashish Kumar Nayak

Code :-

```
int minInsertion(string &str)
{ return str.size() - longestpalindromesubsequence(str);
}
int longestpalindromesubsequence(string s)
{string t = s;
  reverse(t.begin(), t.end())
  return lcs(s, t);
}

int lcs(string s, string t)
{ int n = s.size();
  int m = t.size();
 vector<vector<int>> dp(n+1, vector<int>(m+1, 0));
 for(int j=0; j<=m; j++) dp[0][j] = 0;
 for(int i=0; i<=n; i++) dp[i][0] = 0;
 for(int i=1; i<=n; i++)
     {for(int j=1; j<=m; j++)
       {if(s[i-1] == t[j-1])
          dp[i][j] = 1 + dp[i-1][j-1];
       else
          dp[i][j] = max(dp[i-1][j], dp[i][j-1])
       }
     }
 return dp[n][m];
}
```

@Aashish Kumar Nayak

DP-80

Minimum insertion/deletion to convert string A to string B

str1 → "abcd" str2 = "anc"

Delete everything from str1 and insert all character from str2 to str1.

it takes str1.size() + str2.size operations.

intution what can I not touch

a b c d → anc
(b, d: x)

lets delete b & d

a c — 2 deletion

now insert n

$\boxed{anc}$ — 1 insertion

3 operations

longest common subsequences.

deletions = n − len(lcs)
insertions = m − len(lcs)

$\boxed{n+m - 2\times len(lcs)}$ → Ans

Code :

```
int canYoumake( string &str , string &ptr)
{ return str.size() + ptr.size() - 2*lcs(str, ptr);
}

int lcs( string s, string t)
{ int n = s.size();
  int m = t.size();
```

@Ashish Kumar Nayak

```
vector<vector<int>> dp(n+1, vector<int>(m+1,0));
    for(int j=0; j<=m; j++)
        dp[0][j] = 0;
    for(int i=0; i<=n; i++)
        dp[i][0] = 0;

    for(int i=1; i<=n; i++)
    {  for(int j=1; j<=m; j++)
        {   if(s[i-1] == t[j-1])
            dp[i][j] = 1+dp[i-1][j-1];
            else
            dp[i][j] = max(dp[i-1][j], dp[i][j-1]);
        }
    }
    return dp[n][m];
}
```

~~DP on~~

Distinct subsequences

$s = $ "babgbag" $\quad s_2 = $ "bag"

occurance of s_2 in s_1 in babgbag → 5 Subs Distinct ways

Differents methods of comparing

Trying all the ways → Recursion

Count the no. of ways

```
f()
{
    Base case ↑' ↓0
    f1()
    f2()
    return f1()+f2();
```

// Base case will return 1 or 0 ∵ count ways.

How to write recurrance

(i) Express everything in terms of i & j

(ii) Explore all possibilities

(iii) Count all ways return the summation of all possibilities

(iv) Base case

Aashish Kumar Nayak

$f(i,j)$ $\quad$ S_1 = ~~bagg~~ babgbag (i) n-1

S_2 = bag (m-1)

$f(n-1, m-1)$ — start call

no. of distinct subsequences of $S_2[0 \ldots j]$ in $S_1[0 \ldots i]$

if(j<0) return 1;

if(i<0) return 0

if($S_1[i] == S_2[j]$) if they are matching the string reduced to ba from bag

return (f(i-1, j-1) + f(i-1, j));

else

return f(i-1, j) // Reduced and look for someone else.

Space Complexity :-

TC → exponential

SC → O(N+m)

S_1 → 2^n, S_2 → 2^m

Optimise → overlapping subproblems

↓ Memoization

T.C. O(N×m)

S.C. O(N×m) + O(N+m)

@Aashish Kumar Nayak

Code :-

```
int f( int i, int j, string s, string t, vector<vector<int>> &dp)
{   if(j<0)
        return 1;
    if( i<0)
        return 0;
    if(dp[i][j] != -1)  return dp[i][j];
    if( s[i] == t[j])
        ~~return f(i-1, j-1) + f(i-1, j);~~
        return f( i-1, j-1, s, t, dp) + f(i-1, j, s, t, dp);

return ~~return~~ dp[i][j] = f (i-1, j, s, t, dp);

}   int numDistinct (string s, string t)
{   int n = s.size(); int m = t.size();
    vector<vector<int>> dp(n, vector<int> dp(m, -1);
    return f(n-1, m-1, s, t, dp);
}
```

Tabulation

(i) declare the dp array of same size.
(ii) changing parameter in opposite fashion.

Base case $\boxed{j==0}$ → 1

no string

s_2

$j==0$ → 0

1-based indexing instead of 0-based indexing in order to avoid −1, negative

for(i = 0 → n)

dp[i][0] = 1

Code:

```
int numDistinct(string s, string t)
{ int n = s.size();
  int m = t.size();
  vector<vector<int>> dp(n+1, vector<int>(m+1, 0));
  for(int i=0 ; i<=n; i++)
      dp[i][0] = 1;
  for(int j=0; j<=m; j++)
      dp[0][j] = 0;
  for(int i=1; i<=n; i++)
  { for(j=1; j<=m; j++)
      { if(s[i-1] == t[j-1])
          { dp[i][j] = dp[i-1][j-1] + dp[i-1][j];
          } else
          dp[i][j] = dp[i-1][j];
      }
  }
  return dp[n][m];
}
```

(int) connected back

@Ashish Kumar Nayak

Space Optimization :-

```
int numDistinct (string s, string t)
{ int n = s.size();
  int m = t.size();
  vector<double> prev(m+1,0), cur(m+1,0);
  prev[0] = cur[0] = 1;
  for(int i=1; i<=n; i++)
    { for( int j = 1; j<=m; j++)
        { if( s[i-1] == t[j-1])
            { cur[j] = prev[j-1] + prev[j];
            }
          else {
                cur[j] = prev[j];
               }
          }
          prev = cur;
        }
        return (int) prev[m];
  }; }
```

single array optimization

i = 1 → n

j = 1 → m

if() → cur[j] = prev[j-1] + prev[j]

else → cur[j] = prev[j]

```
int numDistinct(string s, string t)
{ int n = s.size();
  int m = t.size();
  vector<double> dp(m+1,0);
  prev[0] = 1;
  for(int i = 1; i<=n ; i++)
  { for(int j = m; j>=1 ; j--)
    {  if(s[i-1] == t[j-1])
       { dp[j] = dp[j-1]
                 + dp[j];
       }
    }
  }
  return (int) dp[m];
}
```

@Aashish Kumar Nayak

DP-33.

Edit Distance

S_1 = "horse" S_2 = "ros"

1. insert
2. Remove
3. Replace

The minimum no. of steps in which we can convert S_1 into S_2.

---

① Method: delete all characters from S_1 and then insert all characters from S_2 to S_1.

it will take len(S_1) + len(S_2) steps

② Method: ~~replace~~

S_1 = "horse" S_2 = "ros"

replace h with r rorse
remove r rose
remove e ros

It took 3 steps.

Example

S_1 = "intention" S_2 = "execution"

remove 't' inention
replace i → e enention
replace n → x exention
insert u execution

5 operations

String matching using recursion

horse — match — ok
ros
not match min delete
not match end
two case
replace or insert the same char

→ if not matching
→ insert of the same character
→ delete & try finding somewhere else
→ replace & match.

@Aashish Kumar Nayak

Try all ways → Recursion @Aashish Kumar Nayak

How to write Recurrance?

1. Express in terms of (i, j).
2. Explore all paths of matching.
3. Return min(all paths).
4. Base case.

f(i, j)

horse (i)
ros (j)

f(m-1, n-1) → min operation or to convert.

f(i, j)
{
if(s1[i] == s2[j]) s1[0----i] to s2[0---j]
return 0 + f(i-1, j-1); // if they are matching shrink both string and we dont require any steps.
}

1 + f(i, j-1); // insert // if not matching i can insert
1 + f(i-1, j); // delete
1 + f(i-1, j-1); // replace

S_1 gets exhausted return (j+1) steps

horse
ros
f(-1, 1) → min operations to convert empty string to a s2[0---1] "ros"

S_2 gets exhausted return (i+1) operations

S_1 = "horse" (0 1 2)
S_2 = "ros" (-1 0 1 2)
f(2, -1) → min operations to convert "hor" → " "
3 operations

if(i<0) return j+1;
if(j<0) return i+1; & insert

Recursion
TC → Exponential
SC → O(N+m)

overlapping subproblem ⟹ memoize

After memoization

T.C. → $O(N*M)$

S.C → $O(N*M) + O(N+M)$

```
int editDistance(string &str1, string &str2, vector<vector<int>> &dp)
{   if( i<0 ) return j+1;   //  if( i==0) return j+1;
    if( j<0 )  return i+1; // if( j==0) return i;
      if(dp[i][j] != -1) return dp[i][j];
    if (s1[i] == s2[j]) return f(i-1, j-1, s1, s2,
    // s1[i-1] == s2[j-1]                dp[i][j] =
    return 1 + min( f(i-1, j, s1, s2, dp), min(f(i, j-1, s1, s2, dp), f(i-1, j-1, s1, s2
    dp[i][j] =                                                                  dp))
}

int editdistance(string str1, string str2)
{   int n = str1.size();
    int m = str2.size();
    vector<vector<int>> dp(n, vector<int>(m, -1));

    return f(n-1, m-1, str1, str2, dp);
}
```

Tabulation :-

1. Base case — in order to avoid the +1 to everywhere
2. changing parameters
3. copy the recurrence

Code : ~~int f(int i~~
try to write Base case.

f(0,j) $\boxed{i==0}$ return j — Here j can be anything.

Means for(j = 0 → m) dp[0][j] = j; //Base case I

$\boxed{j==0}$ return i

for(i=0 → n) dp[i][0] = i;

@Ashish Kumar Nayak

2. i = 1 — n

j = 1 — m

3. copy the recurance.

```
int editDistance(string s1, string s2)
{   int n = s1.size();
    int m = s2.size();
    vector<vector<int>> dp(n+1, vector<int>(m+1, 0));
    for(int i = 0; i<=n; i++) dp[i][0] = i;
    for(int j = 0; j<=m; j++)   dp[0][j] = j;

    for(int i = 1; i<=n; i++)
        {for (int j = 1; j<=m; j++)
        {
        if( s1[i-1] == s2[j-1]
            return dp[i][j] = dp[i-1][j-1];
        else
            dp[i][j] = 1 + min(dp[i-1][j], min( dp[i][j-1], dp[i-1][j-1]))
        }
        }
    return dp[n][m];
}
```

space optimization

We can definitly optimise the space because there i-1, something like that is involved.

@Aashish Kumar Nayak

Base Cases

$dp[0][j] = j$ → can be written in single array

0	1	2	3	4 - - j

$dp[i][0] = i$ → can be written in single array.

0				
1				
2				
3				
4				

```
int editDistance(string str1, string str2)
{
    int n = str1.size();
    int m = str2.size();
~~for (vector~~
    vector<int> prev(m+1, 0), curr(m+1, 0);
    for(int j=0; j<=m; j++)
        prev[j] = j;
    for(int i=1; i<=n; i++)
    {   curr[0] = i;
        for(int j=1; j<=m; j++)
        {   if(str1[i-1] == str2[j-1])
            ~~curr~~ curr[j] = prev[j-1];
            else
                curr[j] = 1+min( prev[j],
                                 min(curr[j-1],
                                     prev[j-1]));
        }
        prev = curr;
    }
    return prev[m];
}
```

@Aashish Kumar Nayak

DP - 34 Wildcard Matching | DP on string (last problem)

S_1 = "?ay"
S_2 = "day"
all three chars are matching
return true

? → matches with single char.
* → matches with sequence of length 0 or more.

S_1 = "ab*cd"
S_2 = "abdefcd"
return true

S_1 = "cb?d"
S_2 = "abcd"
return false

S_1 = "**abcd"
S_2 = "abcd"
return true

1st thing which comes in brain string matching → we can do using recurrence

Problem faced →
ab*cd
abdefcd
for this star we dont know how much of length of other string it will cover

so we have to try all possible ways

len = 0, 1, 2 → means recursion

so we will try string matching by recursion.

Rules to write Recurrance :-
1. Express (i, j)
2. Explore comparisons
3. out of all comparisons, if anyone can give return true f(n-1, m-1) - 1

Scanned with OKEN Scanner

s1[0 - - - 4]
s2[0 - - - 6]

$f(m-1, m-1) \rightarrow$

$f(4, 6) \rightarrow (T/F)$

0	1	2	3	4
a	b	*	c	d

a	b	d	e	f	cd
0	1	2	3	4	5	6

IF(s1[i] == s2[j] || s1[j] == '?')

return f(i-1, j-1)

Either we can write for loop, but we can do this in straight forward recursion

if(s1[i] == '*')

return f(i-1, j) or f(i, j-1)

return False;

Now Analyze the Base case

@Aashish Kumar Nayak

Base case → return true/false

Either S_1 gets exhausted

S_1 → has no
S_2 → has no } Both are exhausted

if ($\boxed{i<0 \ \&\& \ j<0}$) return true

return true

only S_1 is get exhausted

if ($i<0$ && $j>=0$).

return false

if ($j<0$ && $i>=0$) — only S_2 is get exhausted.

if S_1 is left if has to be all "*"

for (ii = 0 → i)

if (S1[ii] != '*')

return false

return true.

f(i,j)

}

if($i<0$ && $j<0$) return true

if($i<0$ && $j>=0$) return false

if($j<0$ && $i>=0$)

    }

    return dp[ind][prev_ind+1] = len;
}

int longestIncreasingSubsequence( int arr[], int n)
{ vector<vector<int>> dp(n, vector<int>(n+1, -1));
    return f(0, -1, arr, n, dp);
}
```

Tabulation :

Rules.

(i) Base case — $dp[n][n+1] = 0$

∴ we already assign 0 to all so no need to write base case.

(ii) Changing parameter

ind = n-1 → 0

prev_ind = ind-1 → -1

(iii) copy the recurance

Follow coordinates shift.

Code :

```
int longestIncreasingSubsequence(int arr[], int n)
{ vector<vector<int>> ~~dp(n+1, 0)~~;
                dP(n+1, vector<int>(n+1, 0));
  for(int ind = n-1; ind>=0 ; ind--)
    {
      for( int prev_ind = ind-1; prev_ind>=-1; prev_ind--)
      { int len=0 + dp[ind+1][prev_ind+1];
        if( prev_ind==-1 || arr[ind] >arr[prev_ind])
          {  len = max( len, 1+dp[ind+1][ind+1]);
          }
        dp[ind][prev_ind+1] = len;
      }
    }
  return dp[0][-1+1];
}
```

@Aashish Kumar Nayak

Space optimization :

@Aashish Kumar Nayak

```
int longestIncreaseSubsequence (int arr[], int n)
{
  vector<int> next(n+1,0), cur(n+1, 0);
  for( int ind = n-1; ind >=0; ind--)
      {for (int prev_ind = ind-1; prev_ind>=-1; prev_ind--)
        { int len = 0 + next[prev_ind+1];
          if( prev_ind == -1 || arr[ind] > arr[prev_ind])
            {
              len = max( len, 1 + next[ind+1]);
            }
          cur[prev_ind+1] = len;
        }
      next = cur;
      }
  return next[-1+1];
}
```

T.C. - $O(N^2)$

S.C. - $O(N) \times 2$

Example

5	4	11	1	16	8

dp[n]

dp[i] → signifies the longest increasing subsequence that ends at index i.

{5, 16}

{3, 11, 16}

LIS → max of all dp index.

$i = 0$ to $n-1$ max(dp[i])

5	4	12	1	16	8

dp[n]

prev
x = 5

2
already updated

4 greater ✗

11 greater ✓

1 greater ✗

for (ind = 0 → n-1)

for (prev = 0 → ind-1)

if (curr[prev] [arr[ind]]

dp[ind] = max(1 + dp[prev], dp[ind]).

Code :-

```
int longestIncreasingSubsequence( int arr[], int n)
{ vector<int> dp(n,1);
  int maxi = 1;
  for (int i = 0; i<n; i++)
    { for (int prev = 0; prev<i; prev++)
      { if( arr[prev] < arr[i])
        {
          dp[i] = max(dp[i], 1+ dp[prev]);
        }
      }
      maxi = max( maxi, dp[i]);
    }
    return maxi;
}
```

T.C. - $O(N^2)$

S.C. - $O(N)$

This solution will be require if we want to trace the LIS.

DP-43 Longest Increasing Subsequence

In this lecture we will use Binary search $1 \le N \le 10^5$

LIS using Binary search

Recursion
Memoization
Space optimization
Tabulation
Algorithmic approach

in previous lect

T.C – $O(N^2)$
S.C. – $O(N)$
Still more

[1, 7, 8, 4, 5, 6, -1, 9]

Increasing subsequences are

1, 4, 5, 6, 9 — longest

Approach : 1 ~~, 4, 6, 9~~

Try to go every element and form subsequence

[1, 7, 8, 4, 5, 6, -1, 9]

Eg1,

[1, 7, 8, 4, 9] len=4

[1, 4, 5, 6, 9] len=5 → longest

[-1, 9] len=2

But a lot of space will be consumed.

Intuition

- To avoid space we will overwrite instead of creating new array.

[1, 7, 8, 4, 5, 6, -1, 9]

[1, 4, 5, 6, 9]

[1, 4 — instead of making new [1, 4 we will replace in 1st array Replace 4 with 7

arr[] {1, 4, 5, 4, 2, 8}

[1, 2, 4, 5, 8] len = 4 — space has been optimised.

Aashish Kumar Nayak

Binary Element el -> arr[i]

if(find arr[i]).

else find 1st greater of arr[i]

or

lower_bound( )

it gives you 1st index of arr[i]

or

first index > arr[i]

Code :-

```
int longestIncreasingSubsequence(int arr[], int n)
{
    vector<int> temp;
    temp.push_back(arr[0]);  int len = 1;
    for(int i=1; i<n; i++)
    {
        if(arr[i] > temp.back())
            { temp.push_back(arr[i]);
              len++;
            }
        else
            {
                int ind = lower_bound(temp.begin(), temp.end(),
                                      arr[i]);
                temp[ind] = arr[i];
            }
    }
    return temp.size();
}
return len; // len will take less space from temp size()
```

lower bound.

T.C. - O(N log N)
S.C. - O(N)

@Aashish Kumar Nayak

DP-44 Largest Divisible Subset | Longest Increasing Subsequence

@Aashish Kumar Nayak

arr[] = {1, 16, 7, 8, 4}

{1, 16, 8} — subsequence

{1, 8, 16}
{1, 16, 8}
{1, 7, 16}
} subset — not necessary to follow the order.

arr[i] % arr[j] == 0
or arr[j] % arr[i] == 0

lets take an example

{16, 8, 4} (16, 8) (8, 4) (16, 4) Every pair is divisible

{1, 16, 8, 4} (1, 16), (1, 8), (1, 4), (16, 8), (16, 4), (8, 4)
len = 4 — All the pairs are divisible this can be possible ans

print any answer you can jumble it and return.
{1, 16, 8, 4} or {4, 16, 1, 8} ...

intution

sort the array

{1, 4, 7, 8, 16}
{1, 4, 8, 16}
len = 4 — ans

∵ 4 is divisible by 1 so insert it
7 is not divisible by 4.
∵ 8 is divisible by 4 and also if it is divisible by 4 then it will automatically divisible by 1 or previous elements.

we will get longest Divisible increasing subsequence.

LIS code :

```
for( i=1 ; i<n ; i++)
{ for( j=0 ; j<i ; j++)
  { if(arr[i] % arr[j] == 0)
    if( ~~arr[j] < arr[i]~~ && dp[i] < dp[j]+1)
      dp[i] = dp[j]+1
      hash[i] = j
  }
}
```

because it's already sorted just change arr[i] % arr[j] ; or arr[j] % arr[i] ;

Code :-

```
vector<int> divisibleset(vector<int> &arr)
{ int n = arr.size();
  vector<int> dp(n,1), hash(n);
  int maxi = 1;
  int lastindex = 0;
  sort(arr.begin(), arr.end());
  for(int i=0; i<n; i++)
   { hash[i] = i;
   for(int prev=0; prev<i; prev++)
      { if(arr[i] % arr[prev] == 0 && 1+dp[prev] > dp[i])
        { dp[i] = 1+dp[prev];
          hash[i] = prev;
        }
      }
   if(dp[i] > maxi)
   { maxi = dp[i];
     lastIndex = i;
   }
  }
  vector<int> temp;
  temp.push_back(arr[lastIndex]);
  while(hash[lastIndex] != lastIndex)
   { lastIndex = hash[lastIndex];
     temp.push_back(arr[lastIndex]);
   }
  reverse(temp.begin(), temp.end());
  return;
}
```

T.C. $O(N^2)$
S.C - $O(N)$

@Aashish Kumar Nayak

DP-46 Longest Bitonic Subsequence | LIS

arr[] = {1, 11, 2, 10, 4, 5, 2, 1}

Bitonic → increasing then decreasing. or it can be just increase or just decrease

{1, 2, 10, 4, 2, 1}

{1, 2, 10, 5, 2, 1}

{1, 11, 10, 4, 2, 1}

{1, 11, 10, 5, 2, 1}

arr[] = {1, 10, 2, 3, 4, 5, 6}

because of subsequence

{1, 2, 3, 4, 5, 6} len = 6

arr[] = {5, 4, 3, 100, 2, 1}

{5, 4, 3, 2, 1} — len = 5

Both of them are also Bitonic

```
for(i=0; i<n; i++)
  {dp[i]=1
    for( j=0; j<i ; j++)
      { if(arr[i]>arr[j] && dp[i]+1<dp[i])
          dp[i] = 1+dp[j]
      }
  }
```

longest increasing subsequence till index i.

arr[] = {1, 11, 2, 10, 4, 5, 2, 1}

dp1[] = {1, 2, 2, 3, 3, 4, 2, 1}

dp2[] = {1, 2, 5, 2, 4, 3, 3, 2, 1}

2 → common

1 6 3 6 5 6 3 1

3 + 4 = 7 Ans

10 is common

1 = 6 Ans

@Ashish Kumar Nayak

Code:

```
int longestBitonicSequence(vector<int> &arr, int n)
{ vector<int> dp1(n,1);
  for(int i=0; i<n; i++)
   { for(int prev=0; prev<i; prev++)
        { if(arr[prev] < arr[i] && 1+ dp1[prev] > dp1[i])
             { dp1[i] = 1+ dp1[prev];
             }
        }
   }
   int maxi=0;
  vector<int> dp2(n,1);
  for(int i=n-1; i>=0; i--)
   { for(int prev=n-1; prev>i; prev--)
        { if(arr[prev] < arr[i] && 1+dp2[prev] > dp2[i])
             {
               dp2[i] = 1+dp2[prev];
             }
        }
   } } maxi = max(maxi, dp1[i] + dp2[i] - 1);
```

avoid this by using this ↑

```
  int maxi=0;
  for(int i=0; i<n; i++)
   {
     maxi = max(maxi, dp1[i] + dp2[i] - 1);
   }
  return maxi;
}
```

Same O(N) T.C.

T.C. - O(N²)

Brust Ballons | partion DP

arr[] = {3, 1, 5, 8} n = 4

Summation of those coins ↑↑

if we burst 5

Left right

1×5×8 = 40

1×3×1 = 3

for 1, now 3 is already burst

1×1×5 = 5

for 5

1×5×8 = 40

[8]

1×8×1 = 8

1 [3, ~~1~~, 5, 8] 3×1×5 = 15

↓

5 [3, ~~5~~, 8] 3×5×8 = 120

3 [~~3~~, 8] 1×3×8 = 24

8 [8] 1×8×1 = 8

167 → maximum

~~Mount~~ ~~Start from min value to Burst the Balon~~.

[3, 1, 5, 8]

i j

can be any one. so we can think as MCM

[b_1, b_2, b_3, b_4, b_5, b_6]

($b_3 \times b_4 \times b_5$)

+ ($b_1 b_2 b_3$) + ($b_5 b_6$)

Subproblems

This will not work if solving independently

@Aashish Kumar Nayak

$[(b_1, b_2, b_3), \boxed{b_4}, b_5, b_6]$

$\{b_1, b_2, b_3, b_5, b_6\}$

if we take subpart as an individual subproblem and try to solve for b_3 then we can't become it. depends on other portion ~~b_4~~ i.e. b_4.

start thinking in opposite direction

Ex: $1\,[\,3 \;\; \cancel{7} \;\; \cancel{8}\,]\,1$

$[\,3, \cancel{7}, 8\,]$ $\quad 3\times1\times5 = 15$

$[\cancel{7}, 8\,]$ $\quad 3\times5\times8 = 120$

$[\cancel{8}]$ $\quad \rightarrow 1\times3\times8 = 24$

$\rightarrow 1\times8\times1 = 8$

Ex: $\{b_1, b_2, b_3, b_4, b_5, b_6\}$

$i \quad x \quad j$ (ind)

$= (a[i-1]\times a[ind]\times a[j+1]) + f(i, ind-1) + f(ind+1, j)$

$\{b_1, b_4\}$ or $\{b_2, b_4\}$ or $\{b_3, b_4\}$ or 2nd last Burst.

$[b_4]$ $\quad = 1\times b_4\times1$

(last Burst)

@Ashish Kumar Nayak

DP-52

Boolean Expression to True / partion DP

Compression = "T | T & F"

"T & F"

"F"

or → |
& → and
XOR → ^

You have to perform in such a way you will get True

"T | T & F"

"T | F" ① → no. of ways

"T"

"T ^ F | F & F ^ T | F"

(T) ^ (F | T & F ^ T | F) Similar to MCM

( ) | ( )

( ) & ( )

( ) ^ ( )

( ) | ( )

Top (T ^ F | T) & (F ^ T | F)

f(i, ind-1) partition (ind) f(ind+1, j)

left & right

both has to be true.

I'm looking for no. of ways ~~ind~~ left comes true or no. of ways in which right is true.

x + y.
left right

left | Right

T = x_1 T = x_2 = $x_1 \times x_2$

F = x_3 = $x_1 \times x_3$

T ^ T = F

F ^ F = F

T ^ F = T

F ^ T = T

@Aashish Kumar Nayak

left ∧ right

$T = x_1$ $T = x_2$

$F = x_3$ $F = x_4$

$x_1 \vee x_4$

$x_3 \vee x_2$

$\underbrace{\qquad\qquad}_{i \qquad j}$ → T, → F

In How many ways we can make it T or F.

~~f(i,j) is True~~

```
f(i,j, istrue)
{ if(i>j)
      return 0;
```

T | F ∧ T
i j

(T) (F ∧ T) (T | F) (T)
i j i j i j

```
if(i==j)
{ if(istrue==1) return a[i] == 'T'
      else return a[i] == 'F'
```

looking for false.

→ 1 is false
0 is true.

go and try to make partition int ways ⇒

```
for(ind i+1, ind <= j; ind = ind+2)
{ LT = f(i, ind-1, 1);
  LF = = f(i, ind-1, 0)
  RT = f(ind+1, j, 1);
  RF = f(ind+1, j, 0);
```

@Aashish Kumar Nayak

~~ways = 0~~

if(a[ind] == '&')

if(isTrue) ways += LTxRT; else ways += (LTxLF) + (LFxRT) + (RFxLF);

else if '^'

else if '|'

{

~~else~~

}

return ways;

So we are applying recursion

DP-53 Palindrome partitioning - II | Front partition

Given string = bababcbadcede

small string str = aabb n=4

a|a|b|b n-1 partition

3 partion

every individual substring will be palindrome.

aa|bb

pal

a|a|b|b

Such problems are generally solved using front partition

Start from front

b | a b a b c b a d c e d e

1 + ( )

Palindrome

1 + (abcb - -)

1 + (ababcb - -)

1 + (cbadcede)

3 subproblems take the minimum no. of cuts.

take this one

1 + (abcbadcede)

1 + (dcede)

Writing a recurrance :

1. Express everything in terms of index.
2. Express all the ~~ways~~ possibilities.
3. Take the min of all possibilities
4. Write the base case.

Give me the min. cut to make all substring palindrome.

@Aashish Kumar Nayak

```
f(i)
{ if( i == n) return 0;
                temp = " ";   if(dp[i] != -1) return dp[i];
for(j=i ; j<n; j++)
    {                                  temp = b
      temp += s[j];                    temp = ba
                                       temp = bab
        if( isPalindrome (temp))
            cost = 1+F(j+1);
            mincost = min( mincost, cost);
        }
}       return mincost;
        dp[i] =

DP-55

Maximum Rectangle area with all 1s | DP on Rectangles

1	0	1	0	0
1	0	1	1	1
1	1	1	1	1
1	0	0	1	0

$2 \times 3 = 6$ (maximum)

We will solve this question using Histogram

max = 6

if we find 0 then it becomes 0
else previous height will be added.

Code:

```
int maximalAreaofSubmatrixofAll( vector<vector<int> &mat,
                                 int, int m)
{
    int maxArea = 0;
    vector<int> height(m, 0);
    for(int i=0; i<n; i++)
    { for(int j = 0; j<m; j++)
        { if(mat[i][j] == 1)
              height[j]++;
          else
              height[j] = 0;
        }
        int area = largestRectangleArea(height);
        maxArea = max(area, maxArea);
    }
    return maxArea;
}
```

@Ashish Kumar Nayak

```
int largestRectangleArea (vector<int> & histo)
{ stack<int> st;
  int maxA = 0;
  int n = histo.size();
  for (int i = 0; i<=n ; i++)
   {
    while(!st.empty() && (i==n || histo[st.top()]>=
                                  histo[i]))
     {
      int height = histo[st.top()];
        ~~st.top();~~
        st.pop();
      int width;
      if( st.empty())
          width = i;
      else
          width = i - st.top() -1;
      maxA = max(maxA, width * height);
     }
    st.push(i);
   }
  return maxA;
}
```

Brute force

We can do better using dp.

Try to create dp of similar size

dP[i][j]

How many squares end at Right Bottom at (i,j)

Try

	0	1	2
0	1	1	1
1	1	2	2
2	1	2	3

1 sq. he himself
+ he is right most bottom
= 2

sum all of them we will get our ans.

but How we will fill this array.

take minimal of other and adds

min = 2+1 = 3

first row and first column thog themselves are i.e. of size 1.

if there 3 are 1 and if this is 1. then it will form square of size 2.

Now add of of them and return the ans.

@Aashish Kumar Nayak

@Aashish Kumar Nayak

1	1	0
1	1	1
1	1	0

→

1	1	0
1	2	min=0+1 1
1	2	0

— Now add all of them.

min(1,1,1) = 1 + 1 = 2

$$dp[i][j] = \min(\underbrace{dp[i-1][j]}_{\text{upper}}, \underbrace{dp[i-1][j-1]}_{\text{diagonal}}, \underbrace{dp[i][j-1]}_{\text{left}}) + 1$$

Code:

```
int countSquares( int n, int m, vector<vector<int>> &arr)
{ vector<vector<int>> dp(n, vector<int>(m,0));
    for (int j=0; j<m; j++)
        dp[0][j] = arr[0][j];
    for (int i=0; i<n; i++
        dp[i][0] = arr[i][0];
    for( int i=1; i<n; i++)
    { for(int j=1; j<m; j++)
        { if(arr[i][j] == 0)
            dp[i][j] = 0;
          else
            {
            dp[i][j] = 1 + min(dp[i-1][j], min(dp[i-1][j-1],
                                               dp[i][j-1]));
            }
        }
    }
    int sum = 0;
    for(int i=0; i<n; i++) {
        for(int j=0; j<m; j++) {
        sum += dp[i][j]; } } return sum; }
```

add all of them in dp matrix and return.
